

# RV Lighting

## Interior Lighting

Most RV lighting is 12 Volt DC. First came incandescent lights and that is all we had then there was fluorescent more light and didn't use as much energy so your battery would last longer. Then Came LED lighter, brighter and uses even less power. Check them all out to see what works best for your application

## Exterior Lighting

The same transformation happened with exterior lights but the brighter LED exterior lights make everyone safer weather it is because the clearance and tail light can be seen from a greater distance or because the porch light make your campground safer.

## Bulbs and Specialty Lighting

Replacement bulbs are made for incandescent lights, fluorescent lights and LED lights. There are also bulbs that can replace incandescent bulbs with LED. Then there is fun Patio lights and strings of LED Awning lights
